## Analysis

The solo student pilot reported that he landed uneventfully and then taxied to the runup area. He called his flight instructor, opened a new flight plan, then taxied to the runway for departure. During the takeoff roll, about the time of rotation, he felt the airplane shudder. Subsequently, he chose to abort the takeoff. During the aborted takeoff, the airplane porpoised, and the nose landing gear collapsed.

The airplane sustained substantial damage to the fuselage.

The student reported that there were no preimpact mechanical failures or malfunctions with the airframe or engine that would have precluded normal operation.

## Probable Cause and Findings

The National Transportation Safety Board determines the probable cause(s) of this accident to be:

The student pilot's failure to maintain pitch control during an aborted takeoff.

## Findings

---

<b>Aircraft</b>	Pitch control - Not attained/maintained (Cause)
<b>Personnel issues</b>	Aircraft control - Student pilot (Cause)

The National Transportation Safety Board (NTSB), established in 1967, is an independent federal agency mandated by Congress through the Independent Safety Board Act of 1974 to investigate transportation accidents, determine the probable causes of the accidents, issue safety recommendations, study transportation safety issues, and evaluate the safety effectiveness of government agencies involved in transportation. The NTSB makes public its actions and decisions through accident reports, safety studies, special investigation reports, safety recommendations, and statistical reviews.

The Independent Safety Board Act, as codified at 49 U.S.C. Section 1154(b), precludes the admission into evidence or use of any part of an NTSB report related to an incident or accident in a civil action for damages resulting from a matter mentioned in the report. A factual report that may be admissible under 49 U.S.C. § 1154(b) is available [here](#).
